

Triadic Structure Theory:

Survival, Reproduction, and Rebellion

The meaning of human existence is to continuously attain better conditions for **survival** and **reproduction**. This lies not merely in being alive and continuing offspring, but more importantly, in actively choosing and shaping the way one exists. Among individuals, groups, political regimes, even entire civilizations and species, their core driving forces can be summarized as three indispensable dynamic cornerstones: **Survival, Reproduction, and Rebellion**.

Within the Triadic Structure Theory, **Survival** refers to the process by which an individual or group acquires resources (such as materials and security) and avoids risks to maintain basic subsistence under specific time, space, or environment. Its core is **the stability guarantee of current existence**.

Reproduction refers to the process by which an individual or group achieves intergenerational survival through biological continuation, cultural inheritance, or institutional replication. Its core is **the expansion of possibilities for future existence**.

Rebellion refers to the thinking, reflection, questioning, interruption, or even resistance of an individual or group toward the original survival-

reproduction structural environment. Its core is to actively or passively change the logic of existence when the path is imbalanced.

The three form a dynamic interactive framework: **Survival** provides the foundation for **Reproduction** and **Rebellion**; **Reproduction** endows **Survival** with long-term meaning; **Rebellion** adjusts the balance of survival-reproduction through intervention in the path, and promotes the adaptive evolution of the system or individual behavior.

The three are independent yet inseparable, and together constitute the most basic framework for the existence of life and civilization.

The three are independent yet inseparable, and together constitute the most basic framework for the existence of life and civilization.

From the most primitive animal instincts to the institutional arrangements of modern states, from individual daily decisions to grand historical movements, and even to ultimate species survival, we can summarize two underlying goals: **Survival** and **Reproduction**. At this level, humans, as advanced intelligent life, are essentially no different from other natural life forms — except that in human society, this process is more complex and abstract in form.

Survival and **Reproduction** are not opposed to each other; they jointly constitute the two pivots of basic life existence: without **Survival**,

Reproduction is impossible; without **Reproduction**, **Survival** will eventually be unsustainable. This applies to both individual life and the continuation of civilization. Generally speaking, **Survival** has a higher priority, followed by **Reproduction**. Of course, this is not absolute; in various practical situations, **Survival** and **Reproduction** may also be synchronized.

However, diverse behaviors deviating from the established trajectory periodically emerge along the original basic path of life. They may arise from realistic pressures such as imbalanced resource allocation and rigid development models, or from ecological imbalance, social relationship extrusion, or concentration and alienation in institutional operation — and such unnoticed **Rebellion** may ultimately shake the fundamental cycle of original survival and reproduction.

Although the state of **Rebellion** is often difficult to inherit or institutionalize stably for a long time, the tension and reminder it contains always exist. If we take it lightly and allow deep-seated contradictions to accumulate without facing them, it will eventually erode the operational foundation of the two fundamental logics of **Survival** and **Reproduction**, and shake the pivot of existence.

It is worth emphasizing that the triadic structure composed of **Survival**, **Reproduction**, and **Rebellion** is essentially **an unbalanced dynamic system that infinitely tends tow**
